

MICROLEARNING MODULE SAMPLE- AI MODELS, AI TOOLS, AI AGENTS

Duration: 5-10 minutes

Audience: Beginners (Age 10+ or adult learners)

1. Learning objective:

Learners will be able to:

- Define and distinguish between AI models, AI tools and AI agents.
- Identify where AI tools and agents are used in real life.
- Understand when to use an AI tool vs. an AI agent.
- Give an example of when to use an AI tool vs. an AI agent.

2. Introduction

- What are AI Tools?

AI tools are software applications that **assist you by following your instructions**.

They do *not* act on their own.

Examples:

- ChatGPT answering questions
- Canva AI generating designs
- Google Translate translates text
- Grammarly checks grammar

- What are AI Agents

AI agents are systems that can **take multiple steps automatically**, sometimes **without needing your input each time**.

They **plan, execute, and adjust** actions on their own.

Examples:

- Self-driving car adjusting speed & direction
- Customer service bot handling a full conversation

- Google Assistant setting alarms + sending messages
- AI automations (Zapier AI Agent, ReAct agents)
- What are AI Models

An AI model is a trained system that learns from data and uses that learning to perform tasks like prediction, classification, or content generation.

Example:

- Large Language Model
- Prediction Model
- Recommendation Model
- Image Models

3. Best real-world example

AI Model = The Engine

The core intelligence that *thinks, predicts, understands, or generates outputs*.

AI Tool = The Car

A usable product built on top of the engine (model).

It lets people actually *use* the AI in real-world tasks.

AI Agent = The Driver

It uses the tool (car) and the model (engine) to *take actions on its own*, such as planning steps, making decisions, and completing tasks automatically

4. Real-Life Example

- AI Tools
 - ChatGPT is writing a paragraph
 - Canva AI is creating a poster
 - Google Photos enhances an image
 - Duolingo AI is helping with a lesson
- AI Agents
 - A chatbot handling full customer queries

- Siri calling someone + setting reminders
- Roomba navigating rooms and cleaning
- Warehouse robot picking items

5. Quick Knowledge Check (Self-Check)

Ask learners to answer (mentally or write in a notebook):

- What is one example of an AI tool you use daily?
- What makes an AI agent different from an AI tool?
- Which one performs multiple steps automatically?
- Is Google Maps an AI tool or an AI agent? Why?

6. Summary (Easy Recall)

- **AI Tools = Need user instructions**
- **AI Agents = Act autonomously & take multiple steps**
- Tools help you *do tasks*
- Agents *do tasks for you*
- Both are widely used in apps, websites, robotics, and daily life
