

CASE STUDY 02

Responsible AI in Education

Designing a Rise 360 e-learning course for educators on ethical AI use in the classroom

Athira A | Instructional Designer Portfolio | github.com/Athiraajith91

OVERVIEW

This case study documents the design and development of a Responsible AI in Education e-learning course — built independently in Articulate Rise 360 as a portfolio project. The course was designed for educators who are beginning to use AI tools in their teaching practice but have little understanding of the ethical, pedagogical, and practical considerations involved.

Project Snapshot

Project Type	Self-directed e-learning development portfolio project
Target Audience	Educators and instructional designers — beginner AI users
Delivery Mode	Asynchronous self-paced e-learning — mobile responsive
Duration	Approximately 5–10 minutes completion time
Tool Used	Articulate Rise 360 — published with shareable review link
Format	SCORM-ready — compatible with Moodle and Google Classroom

The Problem — Why This Course Needed to Exist

In 2024–2025, AI tools became widely available to educators — but adoption was happening without guidance. From my experience in EdTech and curriculum development, I observed three consistent patterns:

- Educators were using AI tools (ChatGPT, Gemini, Copilot) without understanding how they worked or their limitations
- AI-generated content was being used directly in classrooms without quality review or fact-checking
- There was significant anxiety around AI — either over-trust (using it for everything) or complete avoidance

- No accessible, educator-focused resource existed that addressed responsible AI use practically — most content was either too technical or too theoretical

The gap was not information about AI. The internet has plenty of that. The gap was a structured, pedagogically sound learning experience that helped educators build judgment, not just knowledge.

Audience Analysis

Before designing the course, I identified the key characteristics of the target audience:

Prior knowledge	Basic AI awareness — have heard of ChatGPT but limited hands-on use
Motivation	Curious but anxious — want to use AI but fear making mistakes
Learning context	Self-paced — will access on laptop or mobile between teaching sessions
Key need	Practical judgment — not technical knowledge
Pain point	Do not know what responsible use looks like in a real classroom

Learning Objectives

Five clear objectives were defined before any content was written:

- Define Responsible AI and explain why it matters specifically in educational contexts
- Identify at least three risks of unreviewed AI-generated content — bias, inaccuracy, and Privacy Breaches
- Apply three responsible use principles when using AI tools for lesson planning
- Evaluate AI outputs critically using a simple 4-point review checklist
- Create a personal AI use policy statement for their own teaching context

Instructional Design Decisions — Rise 360 Specific

Several deliberate design decisions were made based on the audience analysis and learning objectives:

- Scenario-based learning over lectures: Every module used a realistic classroom scenario to anchor the content — making abstract ethics concepts tangible and immediately applicable
- Conversational tone: Educators respond better to peer-to-peer language than expert-to-novice. The course was written as if a knowledgeable colleague was sharing what they had learned — not an authority figure issuing guidelines
- Progressive disclosure: Each module revealed only what the learner needed for that concept — avoiding cognitive overload by not presenting the full complexity upfront
- Built-in reflection prompts: Every module ended with a reflection question — encouraging learners to connect the content to their own context before moving forward
- Mobile-first design: Rise 360 is inherently responsive. The course was tested on mobile throughout development to ensure usability for educators accessing between lessons
- Final activity — Included a quiz to test the learner, whether they grasped the concepts or not.

Course Structure

Module 1	What is AI and how does it actually work? — demystifying the technology
Module 2	AI decision flow
Module 3	The risks — bias, hallucination, privacy, and accuracy concerns
Module 4	Responsible use principles — a practical framework for educators
Module 5	Safe AI use (Do's & Don'ts)
Knowledge Check	3-question assessment testing all five learning objectives

Reflection — What I Would Do Differently

This was my first complete Rise 360 course and there are two things I would improve in a future iteration:

- I would add a pre-assessment at the start to identify what educators already know and skip modules covering familiar content — making the experience more personalised
- I would create branching paths for different educator roles — primary school teachers have different AI needs than higher education instructors and a one-size approach has limitations

KEY OUTCOMES

- Complete 5-10 minute e-learning course built in Articulate Rise 360
- SCORM-compatible — ready to upload to any standard LMS
- Mobile-responsive design tested across devices
- Real-world examples throughout each module making abstract AI concepts concrete and relatable for young learners
- Portfolio artifact demonstrating end-to-end Rise 360 development capability

What This Case Study Demonstrates

- Articulate Rise 360 development — from content design to published shareable course
- Audience analysis driving design decisions — not personal preference
- Bloom's Taxonomy applied — objectives ranging from Define (Remember) to Evaluate
- Awareness of AI trends and their educational implications — a growing curriculum need
